Dear Mr Reeve

On-line Pressure Relief Valve Testing System

Following the submission of documentation relating to your testing system and procedures a review has been undertaken on the following aspects:

- test equipment documentation including validation records and operating manual
- scope and status of the documented management system
- quality system procedures relating to equipment calibration and accuracy, testing process, reporting, and training of operatives.

The on-line pressure relief valve testing equipment has also been witnessed during actual testing operations and the results have proved satisfactory.

We are pleased to commend your Tru-Test[®] system for use as part of the competent person in-service examination of pressure relief valves. This is on condition the actual testing is witnessed by the SAFed member company Engineer Surveyor.

The general scope of the SAFed acceptance of your testing system is limited to the safety relief systems defined in your documentation. Its suitability for individual relief valves and situations will need to be addressed within your operating procedures.

The on-line testing system is not acceptable as a substitute for either the strip down of the valve and examination of the component parts at the thorough examination or an accumulation test. The extent and frequency of testing will be defined in the user or owner's written scheme of examination.

A copy of the documentation referred to above has been retained in our records and a copy of this letter has been circulated to SAFed member companies who perform in-service examination of pressure systems.

Yours sincerely

A handwritten signature in black ink, appearing to read 'Peter Wilson', is written over a light blue horizontal line.
